

## Welded Wire Mesh Machine

This machine adopts electrical synchronous control technique. This operation is accurate. It has stable function, firm welded point, and without welded tracks. Not only welded speed is fast, but also it is easy to learn and use. Step motor controls fallen weft, so it is even and accurate, the edge of mesh is regular; it is unnecessary to slice the side. Drawing mesh adopts the equipment with elastic tension link and fixing mesh. It is easy to regulate mesh hole, and mesh size is rather accurate.
